AI Crypto Trading Bot 2027

Coming soon · Join the waitlist for early access

Algorithmic trading: rules instead of gut feeling

A trading bot turns a strategy into exact rules. It reads live prices, calculates indicators such as RSI, EMA or ATR, and acts only when every condition is met. AI adds a second layer: it reads the news, reviews results and suggests better settings.

Example rule (illustration)

IF the market is in a range

AND RSI(14) is below 35 on a closed candle

THEN buy, sized at 2% risk

EXIT at stop loss, take profit or trailing stop

The same rule runs the same way, every time.

Why trade with a bot?

01. Watches the market 24/7

Crypto never sleeps. The bot checks its signals around the clock, on closed candles only.

02. Same rules every time

No mood and no gut feeling. Each strategy follows its own rules exactly.

03. Exits are always applied

Stop loss, take profit and trailing stops are never skipped or moved by hand.

04. Automatic daily loss limit

A kill switch stops trading at the daily loss limit. No willpower needed.

How the bot works in 4 steps

5 exchanges, your own account

Spot trading in USDT or USDC pairs. Your funds stay on your own exchange account, and the bot trades through your API keys.

01. Supported exchanges

Binance, Bybit, Bybit EU, OKX and Bitget. Each one has a demo/testnet mode and a live mode.

02. Fees and limits built in

Per-exchange fee rates and order-size limits apply automatically. Each user has separate keys, settings, positions and reports.

Market-regime detection

Read the market first, then trade

The bot measures trend strength with the ADX indicator.
Then it lets the strategies that suit the current market trade,
and holds back the rest.

01. Trending market

ADX at 25 or higher: trend strategies such as Trend Following and Supertrend can trade.

02. Ranging market

ADX at 20 or lower: range strategies such as Mean Reversion and Grid can trade.

03. Extra filters

A daily 200 EMA trend filter, news and sentiment can block a signal.

9 strategies, on or off per pair

Switch each strategy on or off, also per trading pair.

Risk levels range from DCA (lowest) to Momentum (highest).

Combined mode can ask for 2 confirmations before a trade

Trend Following

EMA/MACD trends, daily
200 EMA filter

Mean Reversion

Buys oversold dips (RSI,
Bollinger)

Supertrend

ATR-based trend signals

Divergence

RSI/price divergence
reversals

Grid Accumulation

Buys in price steps within
a range

Donchian Breakout

Enters above the channel
high

Momentum

RSI + volume spike.
Highest risk

DCA

Small scheduled buys to
accumulate. Lowest risk

AI Signal

AI buy/sell with min.
confidence. Experimental

Real AI, with automatic fallback

Choose your AI provider. If it fails (no credit, quota, rate limit or a bad key), the bot switches to the next provider that has a key.

AI news analysis. Headlines from CoinDesk, Cointelegraph, Decrypt and more are scored for sentiment, with confidence and expiry limits.

AI Review and auto-tune

A daily or weekly AI review of your results can tune the settings. Turn it on or off, or start it by hand. Per-pair auto-tune and pair suggestions too.

The AI Signal strategy and the admin Copilot are optional. Every AI signal passes the same risk checks. It cannot skip a stop loss or the kill switch.

Risk controls on every trade

01. Stop loss and take profit

3% stop loss and 6% take profit by default, with per-pair risk overrides.

02. Trailing stop and profit lock

An ATR trailing stop and a break-even stop follow the trade. Profit lock secures gains after +2%.

03. Position sizing

2% risk per trade, at most 10% of cash per trade and at most 10 open positions.

04. Daily-loss kill switch

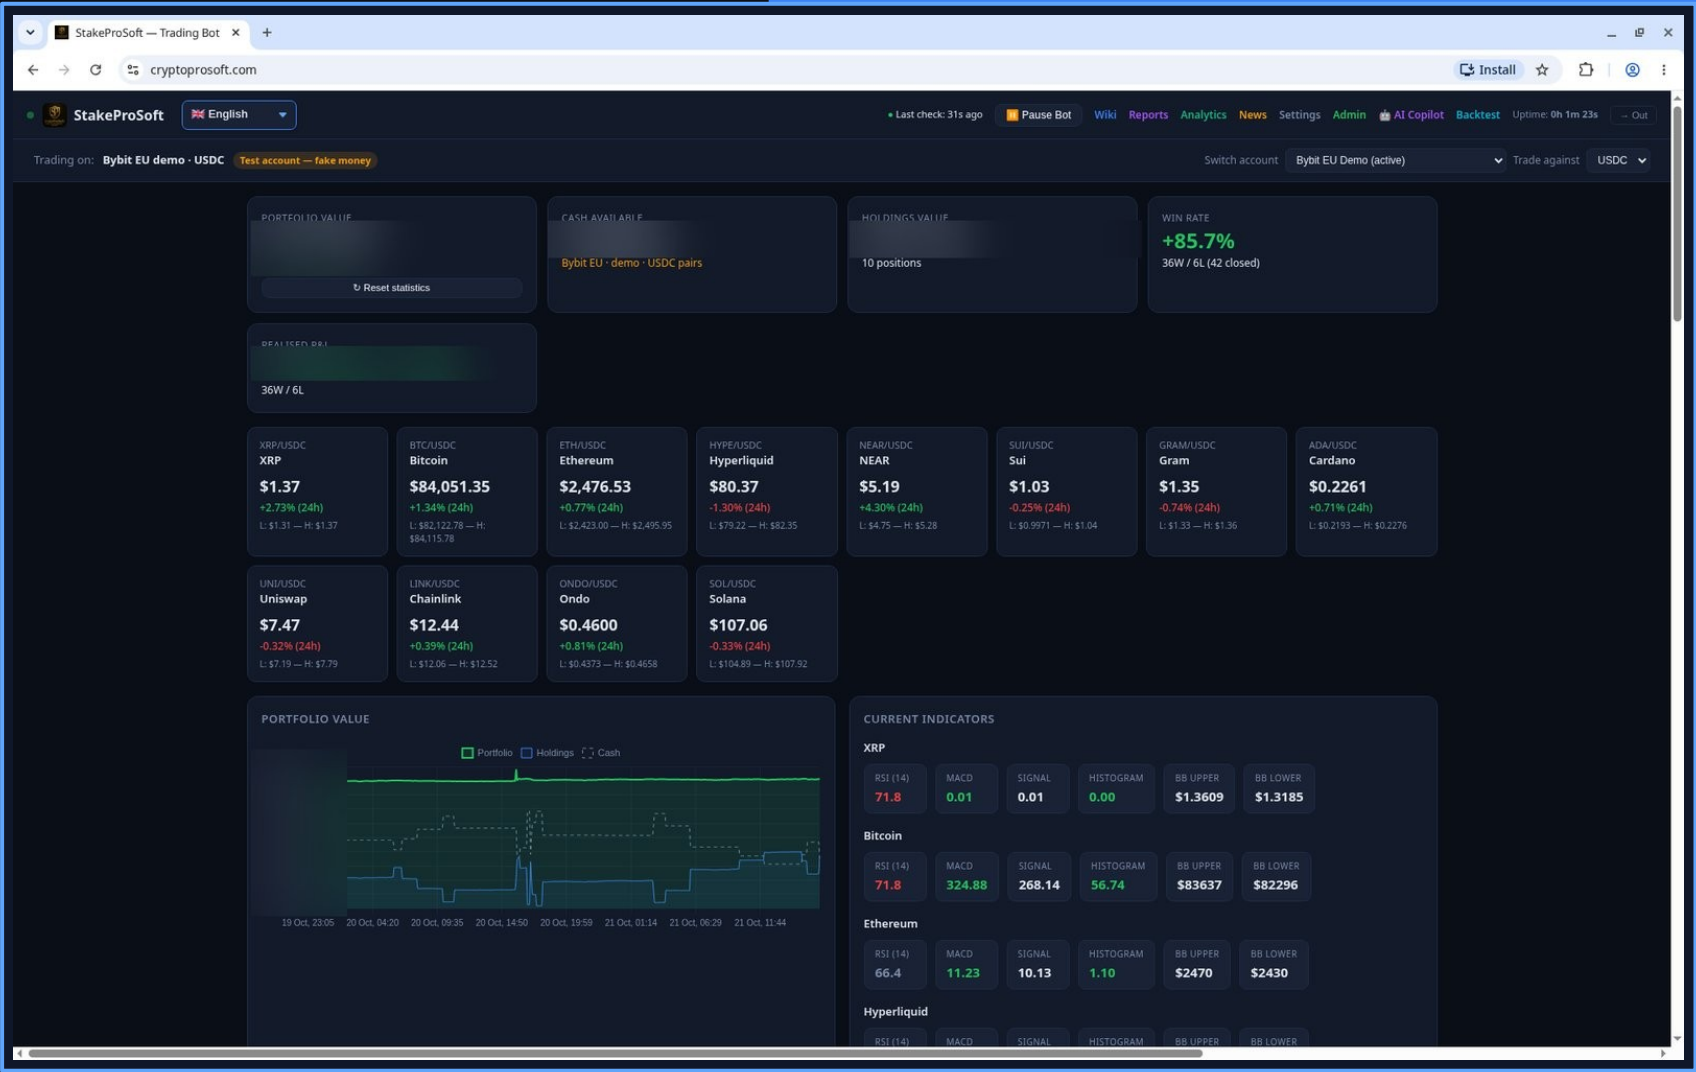

Trading stops at a 5% daily loss (default). Pause, close-all and close-position controls.

The bot trades only on closed candles. Fees and slippage are part of the math.

One dashboard in your browser

Self-hosted web app · 19 languages

Strategies, positions and risk settings in one place. Install it as an app. Analytics, daily reports, a news page and a built-in manual in English and Swedish. Each user gets a separate account.

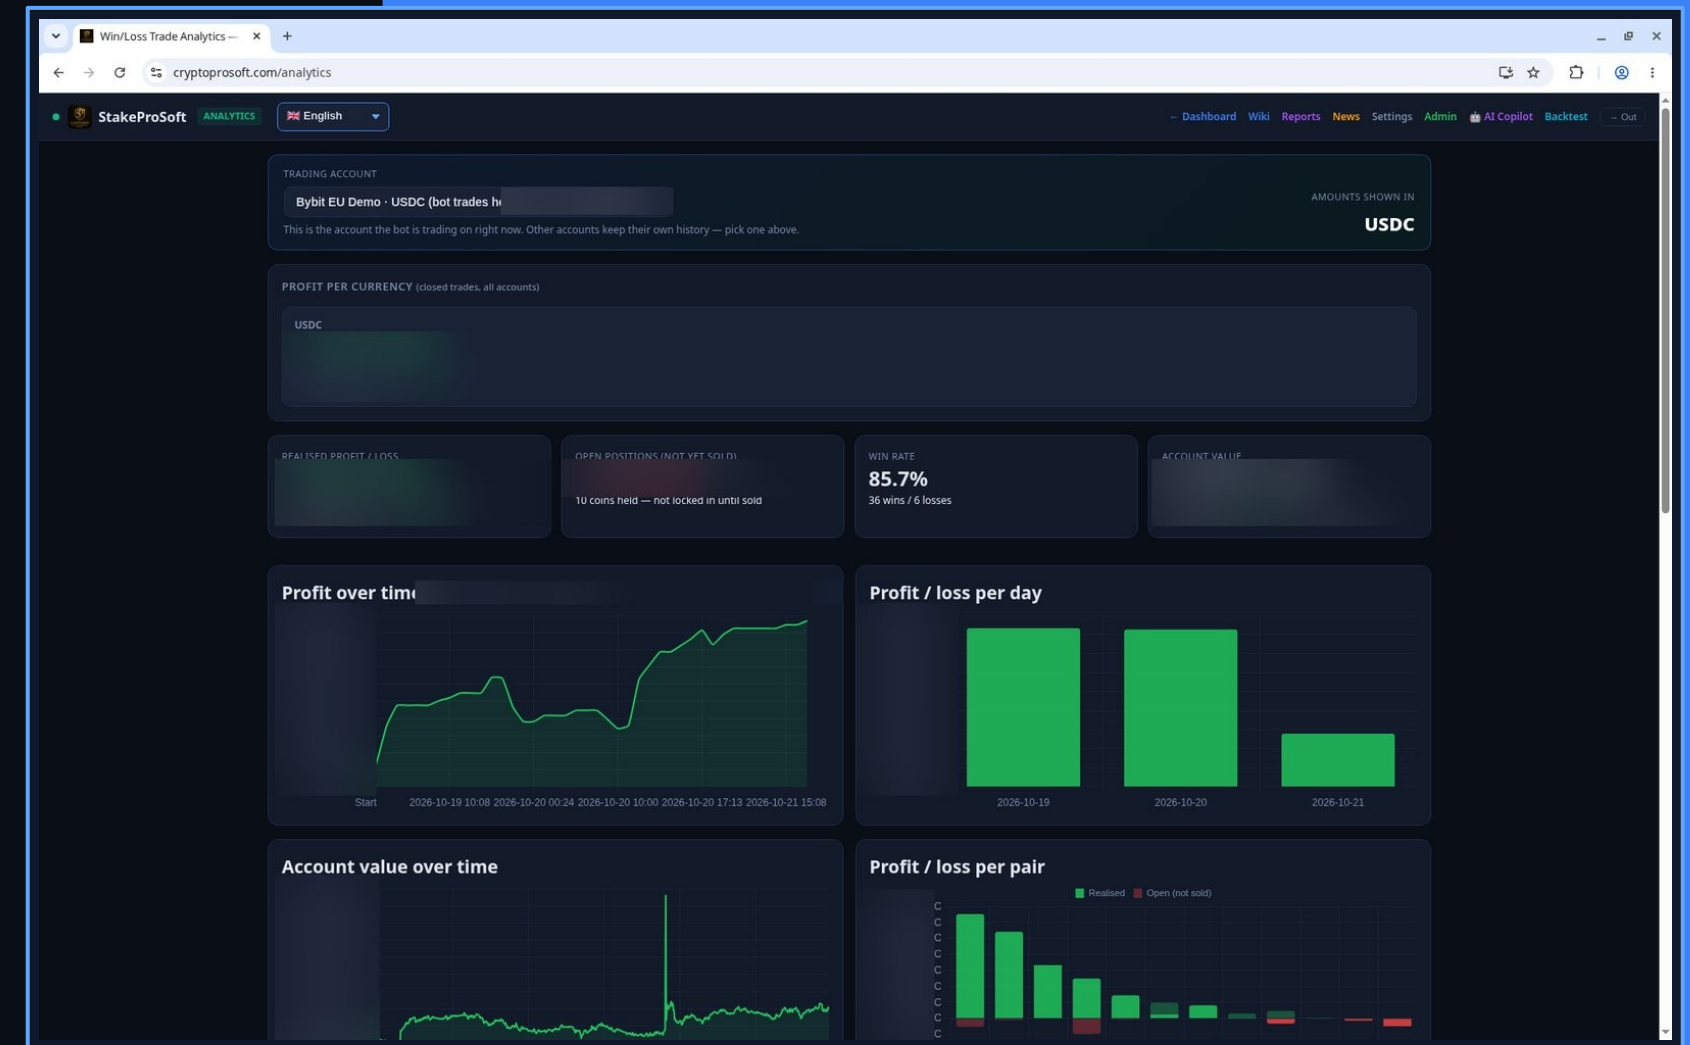

Live dashboard (demo account) – values blurred

Test first, then go live

Run a strategy on downloadable price history in the backtester.
The optimizer finds settings you can save and apply as presets.
Then trade in paper or demo mode before you go live.

3 modes: paper, demo and live

Analytics & charts (demo data) – values blurred

Risk warning

Crypto trading is risky and your capital is at risk. Prices can move fast, and you may lose some or all of your money. CryptoProSoft is software, not financial advice. Past and demo results do not predict future performance. Only trade money you can afford to lose.
